/note="vector: lambda Zip-Lox; Site_1: Sal; Site_2: Not; Lambda PRL2 is a cDNA library derived from equal quantities of 4 pools of mRNA. The mRNA sources were 1) 7 day germinated etiolated seedlings; 2) tissue culture grown roots: 3) staged plants half with 24 hour light cycle, half on 16 hr light, 8 hour dark rosettes; 4) same plants as 3 but aerial issue (stems, flowers and siliques. The vector is BRL's lambda Zip-Lox. The cDNA clasers derived condity of primed cDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  DEFINITION 16899 Lambda-PRL2 Arabidopsis thaliana cDNA clone 189D1577, mRNA sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            130 GGTCACCTGGTTGGTAGTGCACTTTCAGACCCATATCTGTCATTTGCAGCTGCATTAAAT 189

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      /note—Vector: lambda Zip-Lox; Site_1: Sal; Site_2: Not; Lambda PRL2 is a cDNA library derived from equal quantities of 4 pools of mRNA. The mRNA sources were 1) 7 day germinated etiolated seedlings; 2) tissue culture grown roots; 3) staged plants half with 24 hour light expre, and fon 16 hr light, 8 hour dark rosettes; 4) same plants as 3 but aerial tissue (stems, flowers and siliques. The vector is BRL's lambda Zip-Lox. The cDNA linserts were directionally cloned with Sal-Not arms using /db_xref_*taxon:3702*

Lambda PRL2 is a cDNA library derived from equal
quantities of 4 pools of mRNA. The mRNA sources were 1) 7
day germinated etiolated seedlings; 2) tissue culture
grown roots; 3) staged plants half with 24 hour light
cycle, half on 16 hr light, 8 hour dark-rosettes; 4)
same plants as 3 but aerial tissue (stems, flowers and
siliques. The vector is BRL's lambda Zip-Lox. The cDNA
inserts were directionally cloned with Sal-Not arms using
oligo dr primed cDNA.

Lambda PRL2 is a cDNA lbrary derived from equal
quantities of 4 pools of mRNA. The mRNA sources were 1) 7
day germinated etiolated seedlings; 2) tissue culture
grown roots; 3) staged plants half with 24 hour light
cycle, half on 16 hr light, 8 hour dark-rosettes; 4)
siliques. The vector is BRL's lambda Zip-Lox. The cDNA
inserts were directionally cloned with Sal-Not arms using
                                                                                                                                                                                                                                                                                                                                                                Newman, T., deBruijn, F.J., Green, P., Keegstra, K., Kende, H., McIntosh, L., Obiroge, J., Raikhel, N., Somerville, S., Thomashow, M., Setzel, E. and Somerville, C. Genes qalore: a summary of methods for accessing results from large scale partial sequencing of anonymous Arabidopsis cDNA clones 95148729

Statistics: Mean 35.586, Variance 154.962; scale 0.230

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

To identify a cDNA from tobacco which codes for citrate synthase, a cDNA bank of leaf tissue from tobacco was prepd. Plaques of this cDNA bank were screened using a radioactive DNA probe which comprises Solanum tuberosum citrate synthase cDNA (T04199). One of the clones was sequenced, The nt. sequence is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Landschuetze V;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   86.3%; Score 2800; DB 14; Length 459;

Talso new CS sense and anti-sense DNA sequences

Claim 5: Page 15-19: 35pp; German.

The potato citrate synthase (CS) gene or cDNA sequence encoding CS (T03410) may be used to produce antisense CS sequences. CS DNA sequences are useful for altering CS activity in plants. Antisense CS sequences can be used to inhibit CS expression in plants and has the effect of inhibiting flower formation and by doing so improves the plant's storage capacity. This is partie, useful in crop plants of any kind but esp. useful in potatoes. In addition to altering CS activity the DNA sequences can also be used to identify similar sequences in the genomes of other plants and in the production of transgenic plants with altered CS activity. This sequence

represents the anino acid sequence of potato citrate synthase.
                                                                                                                                                                                                                                                                                                                                                                                                                                            PEEGIRFRGFSIPECQKLLPAASAGAEPLPEGLLWILLITGKVPSKFQVDALSADI,RKFAS 119
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                120 IPDHV-YKTIDALPITAHPMIQFCTGVMALQIRSEFQKAYEKGIHKSKFWEPTYEDCLSL 178

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      DNA encoding plant citrate synthase - used to regulate flower formation, to improve storage of tubers, etc. and to reduce sprouting Disclosure; Page 53-50 Ppp; English.

To identify a cDNA from potato which codes for citrate synthase, a CDNA fragment of citrate synthase from Arabidopsis thaliana was firstly amplified using A. thaliana cDNA and oligos T04202 and T04203 which are complementary to the 5' or 3' end of the coding region of introduce BamHI cleavage sites at both ends of the amplified cDNA for citrate synthase. The oligos additionally introduce BamHI cleavage sites at both ends of the amplified cDNA fragment. a cDNA library was prepd. from potato leaves and screened with A. thaliana citrate synthase cDNA. Positive clones were purified and sequenced. The nt sequence is given in T04199.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                452

Disclosurer, Fig 5: 12pp; Japaneses.

The arrA gene encodes the citrate synthase and is part of an acetic acid resistance operon comprising aarA, aarB and aarC. The DNA can be used to prepare an acetic acid resistant strain of bacteria for use in acetic acid fermentation.
                                                                                                                                                                                                                  394 Iflgnlaklk-pwpnvdahsgvllnyygltearyytvlfgvsralgicsgliwdralglp

Pages 19-20. 3 ppp. English.

WCUH 29 - useful for protection against bacterial infections action in the present sequence is a novel methionyl tRNA synthetase protein from Staphylococcus aureus strain WCUH29 (NCIMB 40771), which is related by amino acid sequence homology to Bacillus subtilis tRNA synthetase encoded by the mets gene. The enzyme catalyses the aminoacylation of tRNA-Met, by a two step mechanism. The first step involves formation of a stable enzyme.methionyl adenylate complex resulting from the specific binding and reaction of ATP and L-methionine. Subsequently, the 3' terminal adenosine of anyme-bound tRNA-Met reacts with the aminoacyl adenylate, leading to the seterification of the tRNA and release of AMP. Vectors comprising the DNA (or polynucleotides having at least 70 % identity to it) can be used for the recombinant production of the animonological response in a mammal to generate antibodies to protect against disease. The antibodies protect against disease. The antibodies protect against disease. The antibodies protect against invasion of bacteria, e.g. by blocking adherence of bacteria to damaged tissue, including wounds in skin or connective insummantation of in-dwelling devices, or wounds in the mucous
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Methyl tetrahydropteroyltriglutamate-homocysteine methyltransferase. Streptococcus pneumoniae protein; genetic immunisation; antagonist; immunological response; inoculation; antibody production; inhibitor; T cell immune response; antimicrobial compound; bacterial adhesion; extracellular matrix protein; protein-mediated cell invasion; wound; pathogenesis.

This sequence represents a Streptococcus pneumoniae protein that, based on homology with an E. coll protein, is a methyl tetrahydropteroyltri glutamate-homocysteine methyltransferase, and is encoded by a DNA of the invention. The DNA sequences were isolated from S. pneumoniae strain closops (NCIME 40794). The Streptococcus pneumoniae proteins of the invention can be used to identify compounds which interact with and inhibit or activate the activity of the proteins. Antagonists can be used to treat diseases caused by S. pneumoniae proteins, through genetic immunisation. They can also be used to induce an immunological response in a mammal by inoculation with the S. pneumoniae proteins or delivery of the encoding nucleic acids in a vector adequate to produce antibody and/or recall immune responses to protect the animal from disease. The proteins can also be used to identify antimicrobial compounds which are capable of inhibiting their bioactivity. In particular the proteins of the invention can be used to prevent adhesion of bacteria to mammalian extracellular matrix proteins on in-dwelling devices or in wounds, to block protein-mediated mammalian cell invasion, and to block the normal propertion of pathogenesis in infections initiated other than by the implantation of in-dwelling devices or other surgical techniques.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         249 vyadlvnlpvdaig1-dfvegkktlelvkggfpadktlyvgivngkniwrnnyekslavl 307

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Recombinant transcriptional activator AFT-1 - isolated from Arabidopsis and useful for modifying gene expression and modulating plant defence responses to pathogens.

Bisclosure: Page 25-26; 4/Pp: English.

R89749 is a partial Arabidopsis proteasome, a plant defence-related protein (PRP). This protein and other PDRPS were isolated using a protein residues 33-194 fusion protein, i.e. AFTI (Arabidopsis 14-3-31) protein residues 33-194 fused to Lexa, a DNA binding protein, in an interaction trap assay. AFTI is a transcriptional activator protein and may be used to enhance, control or modify plant gene expression, e.g. in the regulation of plant storage components (esp. napin, legumin or phaseolin). AFTI can also be used to modulate signal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

18. pylori cell envelope transporter protein, 179677.aa.
Cytoplasmic; vaccine; prevention; treatment; infection; identification;
Cytoplasmic; vaccine; prevention; life cytole; activator; bacteria; inhibitor;
duodenal ulcer disease; chronic gastritis; diagnosis; envelope;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Claim 30; rages 401; Habitobacter pylori cell envelope transporter protein. The protein may be used in a vaccine to prevent or treat Protein. The protein may be used in a vaccine to prevent or treat P. Dylori infection or to identify H. Pylori polypeptide binding compounds, useful as potential H. Pylori life cycle activators or inhibitors. The genomic sequence of H. Pylori (ArCC 55679) was determined from overlapping contigs generated by mechanically shearing the bacterial DNA. The sequences were analysed for ORF of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To identify likely H. Pylori antigens for vaccine development, the amilro acid sequences predicted from various ONF were analysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     particular regions can be isolated from H. pylori by PCR amplification for recombinant polypeptide production, e.g. in E. coli hosts.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 184 VVAAYVYRRMYKNGQVIPLD-DSLDYGGNFAHMLGFDSPQMLELMRLY--VTIHSDHEGG 240

                                                                                                                                                                                                                                                     T00532 encodes R84104 the eqfine herpesvirus 4 (EHV) unique short 2 (US2) gene prod. A recombinant attenuated EHV can be produced by deleting the above US2 gene (a region not essential for replication) from the viral DNA. The attenuated virus can be used as a foetal safe vaccine to protect an equine against EHV, or in a test to determine if an equine has been vaccinated against or is infected with EHV.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         156 nkswqpsfv-cgklfetiplttv-dykhllkq-kvlpgqdhpesarsllqhkssfvsppp 212

The inserted sequence is a piece of foreign, double stranded DNA which encodes an RNA molecule which does not naturally occur in the animal into which the EHV is introduced. The foreign DNA sequence is introduced into the EHV is a homology vector. The recombinant EHV's are used to prepare vaccines to protect horses from infectious EHV. Recombinant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       6; Gaps

Cometabolism. The protein may be used in a vaccine to prevent or treat H. pylori infection or to identify H. pylori polypeptide binding compounds, useful as potential H. pylori life cycle activators or inhibitors. The DNA and probes derived from it may be used for the identification of H. pylori in a sample and the diagnosis of H. pylori infection. Nucleic acid sequences complementary to the DNA act as antisense sequences and can discribution of H. pylori-specific antigens. The genomic sequence of ad distribution of H. pylori-specific antigens. The genomic sequence of H. pylori (ATCC 5679) was determined from overlapping contigg generated for ORF of at least 180 nucleotides, and the predicted coding regions for ORF of a least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF interest marriang the and determined from or exported interest particular marriance and determined from the requences of interest marriang the marriance and determined from the requences of interest marriang the marriance proteins. Having identified and determined the sequences of interest.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                interest, particular regions can be isolated from H. pylori by PCR amplification for recombinant polypeptide production, e.g. in E. coli
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

Mean 49.897; Variance 94.480; scale 0.528 Statistics: Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
